B.Tech II Year II Semester (R13) Regular & Supplementary Examinations May/June 2016
PULSE & DIGITAL CIRCUITS
(Common to ECE and EIE)

Time: 3 hours

Max. Marks: 70

PART – A
(Compulsory Question)
*****

1   Answer the following: (10 X 02 = 20 Marks)
- (a) What is meant by linear wave shaping?
- (b) How can an uncompensated attenuator be modified as a compensated attenuator?
- (c) List the applications of voltage comparators.
- (d) State Clamping circuit theorem.
- (e) What is the main advantage of an emitter-coupled monostable multivibrator over collector-coupled monostable multivibrator?
- (f) What is meant by loading in a bistable multivibrator?
- (g) Draw a current sweep circuit.
- (h) Define the terms phase delay and phase jitter.
- (i) List the applications of sampling gates.
- (j) List the disadvantages of ECL.

PART – B
(Answer all five units, 5 X 10 = 50 Marks)

$\boxed{\textbf{UNIT – I}}$

2   (a) A ramp $V_i = \alpha t$ is applied as input to a low-pass RC circuit. Derive the expression for the output voltage. And also draw the typical waveforms.
     (b) A 20 KHz square wave is applied to a RC differentiating circuit, with R = 4 KΩ, it produces the output with a tilt of 5%. Calculate the value of the capacitor and lower 3-dB frequency.

OR

3   (a) Derive the expression for percentage tilt, 'P' when a square wave is input to a high-pass RC circuit.
     (b) An oscilloscope test probe shown below has a cable capacitance of 50pF. The input impedance of oscilloscope is 1 MΩ in parallel with 5pF. Find the value of the capacitor for better performance.

www.jntuonline.com
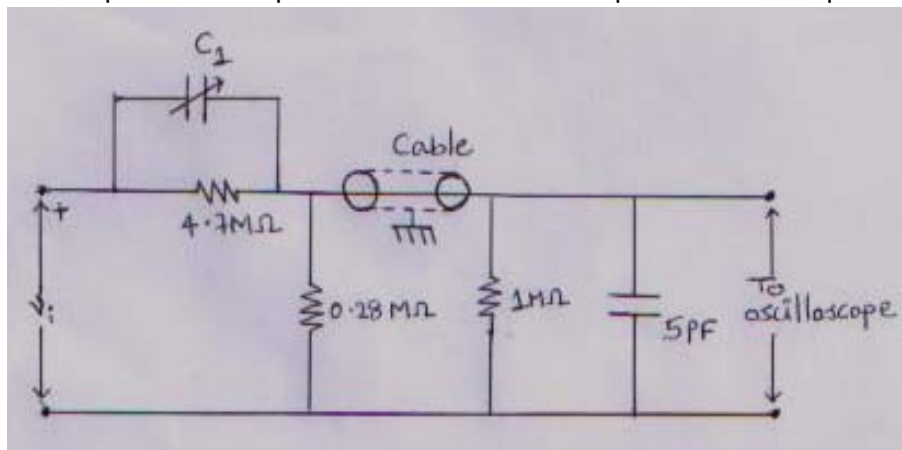

4   (a)   For the two-level clipper in Figure below, the input varies linearly from 0 to 150 V. Plot the transfer characteristic and obtain the output voltage. Assume ideal diodes.

   (b)   What is meant by synchronized clamping?

OR

5   (a)   Explain the effect of diode characteristics on clamping voltage.
    (b)   Discuss any two applications of voltage comparators.

UNIT – III

6   In a Schmitt trigger circuit shown below, with two 7N4418 n-p-n epitaxial planar silicon transistors, the h_{FE} of the transistors is 70. The circuit is energized from a power supply voltage V_{CC} = 10 V. The resistors in the circuit are R_s = 3.3 KΩ, R_{c1} = 2.2 KΩ, R_{c2} = 820 Ω, R_1 = 1.8 KΩ, R_2 = 6.8 KΩ and R_e = 4.7 KΩ. Determine the two voltages associated with upper-tripping point and lower-tripping point.
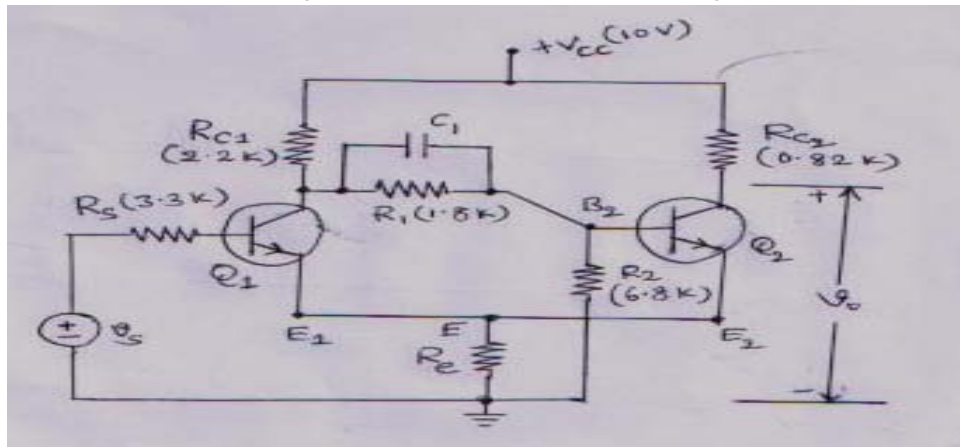

OR

7   (a)   Draw and explain the operation of collector-coupled astable multivibrator.
    (b)   Distinguish between symmetrical triggering and unsymmetrical triggering.

UNIT – IV

8   (a)   Define the three errors that specify deviation from linearity.
    (b)   Explain the basic principle of a bootstrap sweep generator. Draw the circuit and explain its operation.

OR

9   (a)   Explain the synchronization of a sweep circuit with symmetrical signals.
    (b)   Write a brief note on frequency division in a sweep circuit.

UNIT – V

10 (a)   Draw the circuit of a bidirectional sampling gate and derive the expression for its gain.
    (b)   Explain about reduction of pedestal in a gate circuit.

OR

11 (a)   With a neat sketch explain the working of a DTL NAND gate.
    (b)   Compare various logic families.

*****
